

# Capstone project

## The SmartAlert device

**Vasileios Tsoumpris**

Data Analytics and ML Consultant

**Business Analytics Programme**

From Data to Decisions

# Business Proposal Statement

Introducing a new remote patient monitoring device,  
**The SmartAlert.**

Our company can expand its reach and provide a comprehensive solution to a wider range of patients by utilizing our expertise in remote patient monitoring and building upon the success of our current device, HeartSafe.

The new device will offer monitoring capabilities for various medical issues, including fainting, COPD, hypoxia, and heart problems. This expansion can result in increased profitability for our company.

# The Business Problem

Is **replacing** the present and simpler HeartSafe device with the new and more expensive SmartAlert device **more profitable**?

Should we consider producing a **combination of both**?

**Which scenario** is more profitable with **our current resources**?

After thoroughly analyzing our technical and business aspects, **we have concluded that producing a combination of both devices will yield higher profits:**

**Scenario 1:** Producing a combination of both devices will yield 192,000 US\$ in profits.

**Scenario 2:** Producing only SmartAlert will yield 120,000 US\$ in profits.  
*Contrary to the HeartSafe, the SmartAlert is more expensive and more difficult to produce as it is enhanced with more sensors.*

**Scenario 3:** Producing only HeartSafe will yield 150,000 US\$ in profits  
*HeartSafe is specifically designed for patients who have heart medical issues, making its target audience more narrow compared to SmartAlert.*

# The Optimisation Problem - Producing a combination of both devices is the most profitable option.

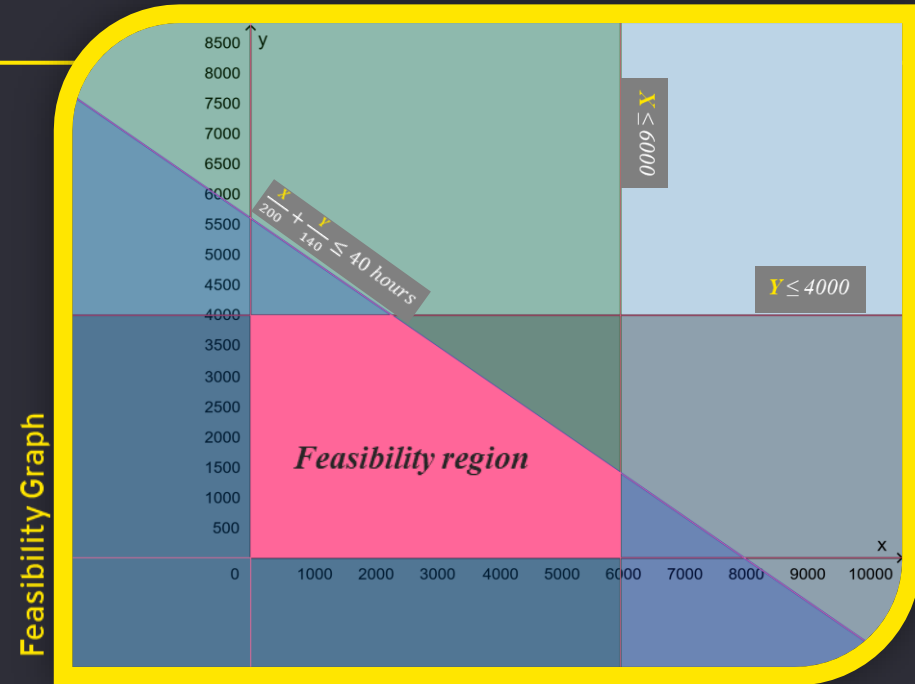

## ► Framing the problem:

### ► Decision Variables:

- $X$  is the number of HeartSafe devices we produce
- $Y$  is the number of SmartAlert devices we produce

### ► Objective Function:

- **Maximize the profits:**  $25X + 30Y$ 
  - Note: The profit per  $X$  device is \$25, and for  $Y$  is \$30

## ► Subject to constraints:

- Weekly production capability of HeartSafe device due to person-hours and specialists available:  $X \leq 6000$  devices
- Weekly production capability of SmartAlert device due to person-hours and specialists available:  $Y \leq 4000$  devices
- Weekly hours capacity due to available machinery:  $\frac{X}{200} + \frac{Y}{140} \leq 40$  hours
- Number of devices is a non-negative value:  $X, Y \geq 0$

## ► Tool used: AMPL - why?

- **Expressive Modeling Language:** AMPL offers a high-level modelling language that allows you to describe optimization problems in a natural and intuitive manner.
- **Solution Analysis and Post-Processing:** AMPL provides facilities for analyzing and interpreting the results of your optimization models.
- **Large-Scale Problem Handling:** AMPL is designed to handle large-scale optimization problems efficiently.
- **Integration with Other Tools:** AMPL can be easily integrated with other programming languages, modeling languages, and data analysis tools.

# Interpretation of Results - Producing a combination of both devices is the most profitable option.

The AMPL solver that was used was MINOS version 5.51. With only two iterations, the solver found an optimal solution for producing HeartSafe and SmartAlert Devices.

According to the optimal solution, we should produce the following:

- ▶ 6000 devices of type HeartSafe (X)
- ▶ 1400 devices of type SmartAlert (Y)
- ▶ With a number of 192,000\$ as total profits

In addition:

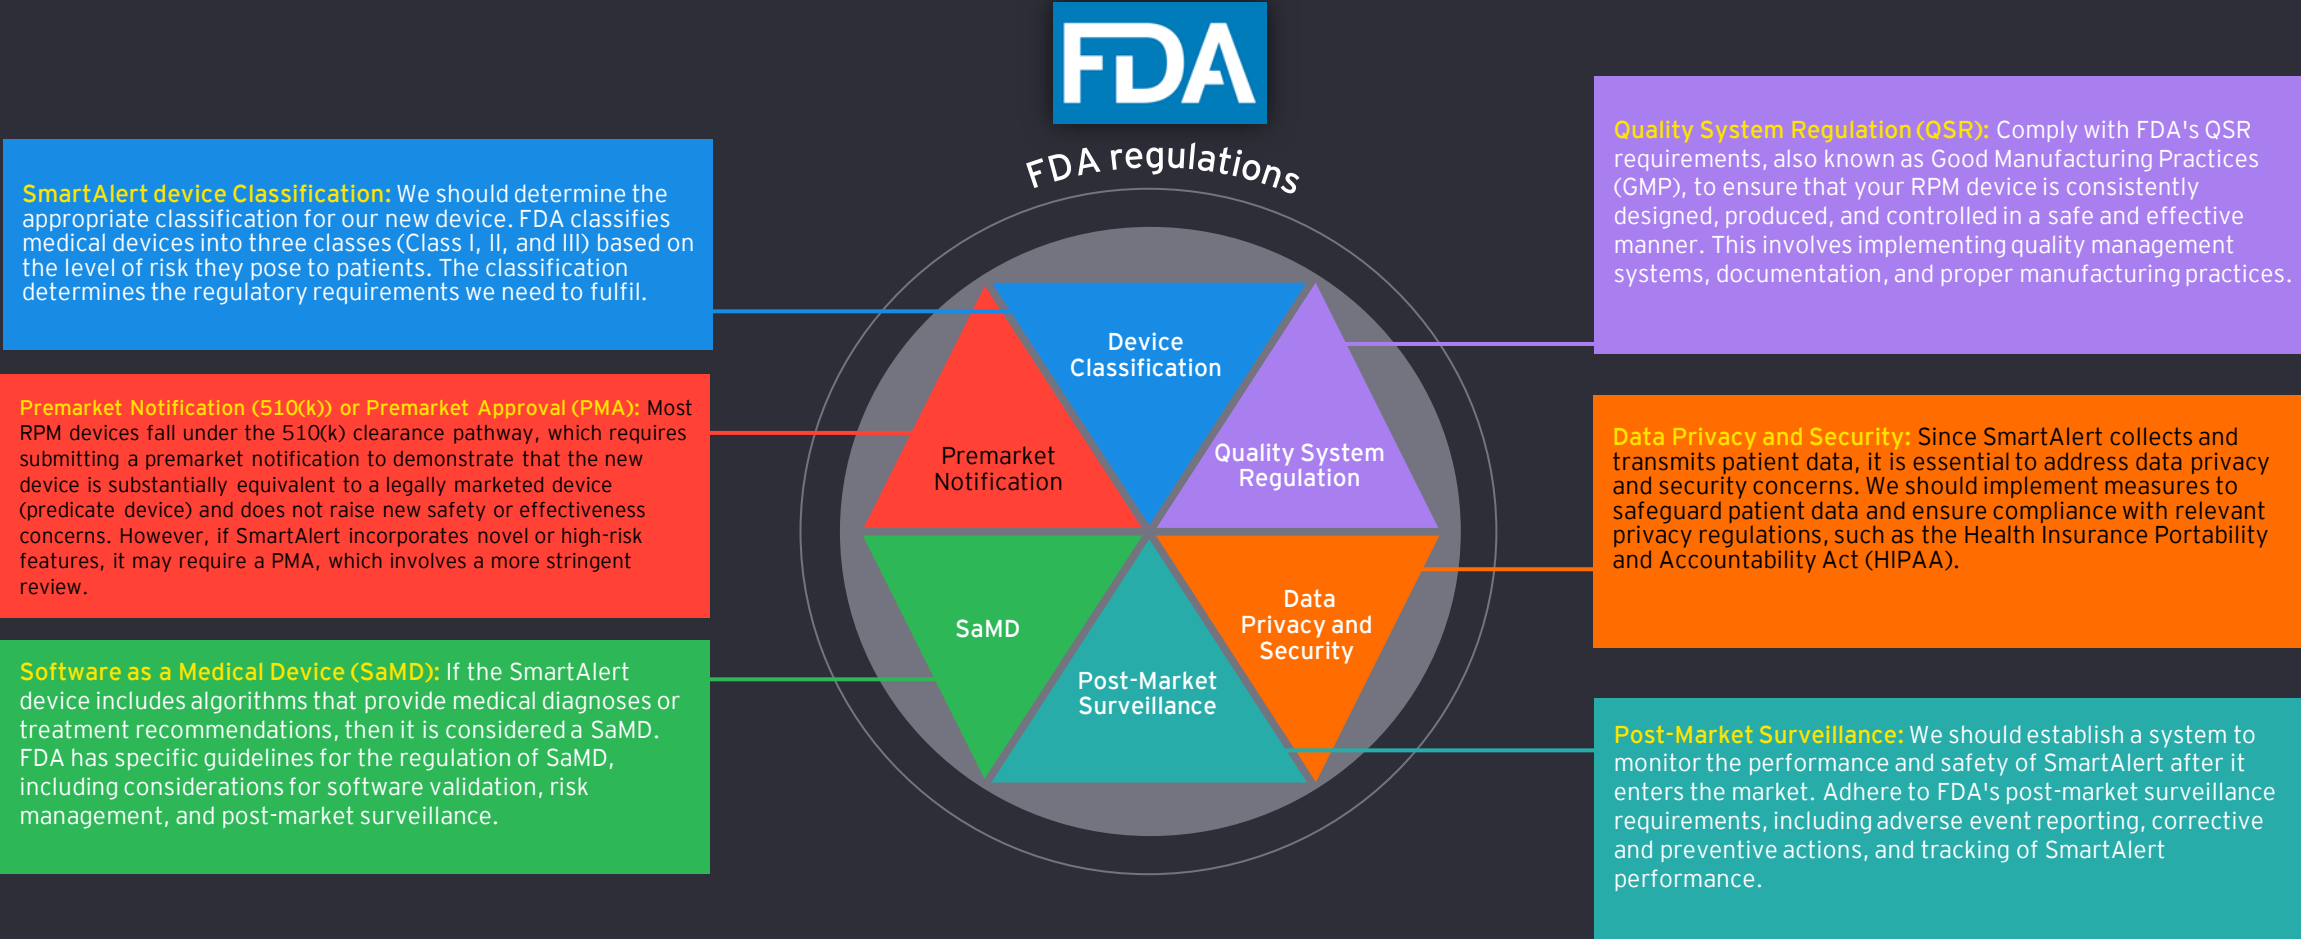

- ▶ The weekly production capability of HeartSafe (X) due to person-hours and specialists available is fully exploited (*constraint slack = 0*)
- ▶ The weekly production capability of SmartAlert (Y) due to person-hours and specialists available is not fully exploited (*constraint slack = 2600*)
- ▶ The above slack is justified by the weekly hours capacity due to available machinery constraint, which is almost fully exploited (*constraint slack = 7.10543e-15*)

According to the results, although the production of the combination of both devices is the most profitable, we could increase the production of SmartAlert devices by investing in machinery.

Number of devices produced according to optimal solution and constraints

# FDA Regulations to consider

# Market Analysis and Demand for SmartAlert device

## Mobile Health

The regulated medical app market is expected to reach **US\$12.2b by 2030** at 23% CAGR

We experience a rise in digital therapeutics to drive the growth in mobile applications focused on specific health conditions

**Type 2 Diabetes** has the largest number of mobile applications among all indications

## Electronic Health Records (EHRs)

EHR market revenue is expected to reach **US\$3.2 in 2030** at a CAGR of 6% from 2022 - 2030

**US** is the highest revenue generating market with expected **US\$746m in revenue in 2023**

The EHR market is highly regional due to variation in local regulations and laws

## Telehealth

The telehealth market is expected to reach **US\$2.3b in 2023**

Telemedicine ranks third in the top indications for digital health pipeline products in 2023

As per a 2022 survey by Rock Health, **80%** of the respondents **report using telemedicine at some point in their lives**, up from 72% in 2021 survey

# Alliances and Competition in the healthcare market

A plethora of healthcare organizations are leveraging Remote patient monitoring and digital services to strengthen relationships, improve patient outcomes and to transition patients from hospital based care to home based care setting

## Support for chronic conditions

- ▶ **Mayo Clinic** partnered with **NXgenPort**, to support the development of a cancer-focused Remote Patient Monitoring device that can remotely monitor early signs of complications
- ▶ **Geisinger** announced the launch of **ConnectedCare365**. The system allows patients to monitor their vitals, such as their blood pressure, glucose and other metrics and update them using a smartphone app

## Remote monitoring solutions for everyday applications

- ▶ **CVS** launched medical alert system to help caregivers monitor their family members from afar. The collection consists of in-home devices and wearable devices
- ▶ **Independence** partnered with **Podimetrics** to remotely monitor its members with diabetes and a history of diabetic foot ulcer using **SmartMat** to detect early warning signs of foot complications

## Continuous patient monitoring for Hospital@Home programs

- ▶ **Brigham and Women's Hospital** partnered with **Biofourmis** to roll out AI based remote monitoring, providing patients with 24/7 remote monitoring through biosensors
- ▶ **Kaiser's** RPM program provides patients with Bluetooth-enabled monitors that can send their BP or blood sugar readings to their EHR in real time and can be reviewed by the care team members to monitor patients' progress

## Digital services

- ▶ **Elevance Health** launched **Sydney Health** to allow members access health benefits information and receive personalized recommendations for physicians and wellness options
- ▶ **Humana** partnered with **Vida Health's** virtual diabetes management program to provide members access to Vida's diabetes coaching, in-app peer group support, and digital therapeutics

# Overproduction and Underselling – Causes and Strategic Decisions

Overproduction of devices and Underselling

## Our strategic approaches

### Commercial and Marketing decisions

Align our commercial policy. Develop a marketing campaign to better explain the product benefits to customers.

### Mitigating defects in production

Apply advanced quality control standards and processes. Adapt to the new trends in manufacturing technology.

### Customer Research and Analysis

In addition to the secondary market research, we should conduct Exploratory research via open-ended questions (questions may be posed in focus groups, telephone interviews, or questionnaires).

# Conclusions and Anticipated Results

---

SmartAlert is the future for our company. An advanced technological device covering broader monitoring capabilities for various medical issues.

Adding SmartAlert to our product portfolio will expand our reach to a wider range of patients, increasing our company's profitability.

# Thank You

---

## Follow-Up Questions

### Patient Safety

- ▶ We need to focus on how to tackle users' safety concerns.
- ▶ Some factors to be considered that impact safety requirements are:
  - ▶ What is the level of dependence by the patient on the output information?
  - ▶ What is the ability of the patient to detect erroneous output information?
  - ▶ What is the level of influence that output information has on clinical intervention

### Cyber Threats

- ▶ Interoperability of the smart devices like SmartAlert comes at the cost of potential cybersecurity threats
- ▶ Risks vary from malware type to advanced social engineering attacks
- ▶ What strategies can we implement to address cybersecurity threats of this nature?
